

Project Summary: Personal Knowledge Base

"Build A Person's Knowledge Base Shared with the World"

"Build A Person's Knowledge Base Shared with the World"

1. Project Vision

A federated knowledge base architecture where:

- The Person collects knowledge through automated and manual means
- Knowledge is stored centrally with version control (GitHub)
- Consumers (humans or AI agents) obtain the knowledge base and interact with it through their own AI agents

The Person does not host the interaction layer consumers bring their own AI to the data.

2. Target Model

Public Figure / Influencer Model

- Like Nikita or Naval Ravikant
- Fully public access (anyone can read/clone)
- Continuous updates as The Person generates new content

3. Content Sources

The Person has multiple data sources:

- Published articles
- Social media posts (Twitter/X)
- YouTube videos
- Personal notes
- And more...

4. Architecture Overview

The Person	GitHub	Consumer
	(Central)	AI Agents
Auto-collect	Markdown	git clone
Manual add	wiki links	local search
GBrain/Hermes	Versioned	voice chat
Scheduled commit	Embeddings	video chat

5. Detailed Components

5.1 Collector Tool (Personal, Private)

Input Methods:

Type | Method

|-----|-----|

****Auto-collection**** | Social APIs (Twitter/X, YouTube), RSS feeds, web scrapers

****Manual inputs**** | Web clipper, email-to-KB, Obsidian plugin, mobile app

Processing:

- Normalize to Markdown
- Extract entities
- Generate embeddings
- Suggest wiki links

Scheduler:

- Auto-commit to GitHub on schedule OR event-triggered
- Daily recommended frequency

Implementation:

- GBrain + Hermes Agent with custom skills
- Minimal configuration via YAML

5.2 Central Place (GitHub Public Repository)

Repository Structure:

```
person-knowledge-base/
  people/                # Person profiles
    example-person.md
  concepts/              # Concept explanations
    leverage.md
  sources/               # Raw source material
    podcast-interview-2024.md
  notes/                # Personal notes
    thought-on-ai.md
  meta.json              # Schema definition
  embeddings/           # Pre-computed vectors
    nomic/
  README.md              # Getting started guide
```

Content Format:

- Markdown files with YAML frontmatter
- Obsidian-style `[[wikilinks]]` for connectivity
- Frontmatter metadata: date, source, tags, type, author

Version Control:

- Git tags/releases: Weekly curated snapshots (e.g., "v2024.04")
- Nightly main branch: Auto-committed raw additions
- Optional: Webhook push notifications for subscribers

5.3 Consumer Access (Distributed)

Mode | How It Works

|-----|-----|

****Download**** | ``git clone github.com/person/kb`` Full access to raw data

****Direct Search**** | Consumer indexes repo locally (vector DB like GBrain) for semantic sea

****Work Chat**** | Consumer's AI loads repo as RAG context

****Voice Chat**** | Consumer's agent + Whisper (STT) + Piper (TTS)

****Video Chat**** | Consumer's agent + WebRTC (LiveKit, Daily.co)

No central server required consumers own their interaction layer.

6. Design Decisions

A. Data Format

- Single source: Markdown files
- Wrapped: Wiki-style with internal links
- Priority: Human readable first, machine parseable second

B. Update Mechanism

Hybrid approach:

1. Git tags/releases Weekly curated snapshots (stable)
2. Nightly main branch Auto-committed raw additions (fresh)
3. Optional webhook For real-time push notifications

C. Personalization Layer

Feature | Decision

|-----|-----|

****Fork**** | Yes Consumers create their own view

****Private annotations**** | Local only No changes to public data

****Feedback to Person**** | Two channels: Public (GitHub Issues) + Private (Encrypted email/S

D. Collector Tech

- Tool: GBrain + Hermes Agent with custom skills
- Config: Single YAML file
- Operation: Minimal configuration, set-and-forget

7. Consumer Workflow Example

```
# Step 1: Get the knowledge
$ git clone github.com/person/knowledge-base
# Step 2: Index for personal use
$ gbrain index ./knowledge-base --embed-model nomic
# Step 3: Chat with it (own AI agent)
$ hermes --system-prompt "You have access to this repository..."
# Step 4: Add private annotations (local only)
$ echo "My thought: [[AI]] will change everything" >> ./private-annotations.md
```

8. Potential Project Names

Name | Rationale

|-----|-----|

****nomadic-kb**** | Knowledge that travels with consumers

****personal-wiki**** | Clear, descriptive, boring

****memex-public**** | Vannevar Bush's vision, realized

****persona-code**** | Identity as code

9. Next Steps

1. Finalize project name
2. Create prototype repo structure Set up initial GitHub repository
3. Build collector skill GBrain/Hermes skill for auto-ingestion
4. Test consumer workflow Verify end-to-end flow (collect commit clone search chat)
5. Document API/schema For other developers who want to build on top

10. Key Principles

1. Human-readable first GitHub repo should be browsable without tools
2. No lock-in Markdown files can move anywhere
3. Consumer owns the experience They choose how to interact
4. Single source of truth GitHub is canonical, forks are derivatives
5. Minimal maintenance Set up once, runs automatically
